

401 :- spring security is blocking the endpoints
implementing class

Q401 :- Spring

Configuration : class is a setup/config class
Instructions for Spring

Instructions

@Bean : run this method to store the result.

→ 201 created :- means your API succeeded.

Service layer :- decides what to do.

• Dist controller

* This tells spring:

- this class handles REST API's.
- return data as JSON automatically.
- return HTML pages, if needed.

- return data as
- so instead of returning HTML pages, it returns JSON responses.

② Request Mapping ("api/upload").

• This sets base URL for all methods in this controller.

so all endpoints inside this class start with : /api/upload

 $4x^2$

Ex:-

① Required Arg constructor (No need to create manually)

@RequiredArgsConstructor constructor (RequiredArgsConstructor)

- It automatically creates a constructor for:

```

xxx
-> private final UploadService uploadService;
      datatype      ↓ default reference      ↓ var name.
  
```

So spring can inject the service bean automatically. (initializing variables).

note:- private :- with a class can access
final :- cannot reassign

without writing constructor manually, it becomes like this internally.

```
-> public UploadController(UploadService uploadService)
    {
        this.uploadService = uploadService;
    }
```

primitive datatype :- Only values / Just value

Object type :- needs methods, multiple data, string dependency, real-world data.

@CrossOrigin

Ex: @CrossOrigin(origins = "*")

This allows frontend from another from another port like:-

http://localhost:5173

to call backend APIs.

* * without this browser may block request because frontend and backend run on different origins.
