

without writing constructor manually, it becomes like this internally.

```
-> public UploadController(UploadService uploadService)
    {
        this.uploadService = uploadService;
    }
```

primitive datatype :- only values / Just value

Object type :- needs methods, multiple data,
String dependency, real-world data.

@CrossOrigin

ex: @CrossOrigin(origins = "*")

This allows frontend from another from another port like:-

http://localhost:5173

to call backend APIs.

* without this browser may block request because frontend and backend run on different origins.
